WINDOWS 7 32 BIT). 10 64 BIT Adobe .Q: MySQL issue with simple table and single column insert I am still quite new to MySQL and am experiencing some really weird behaviour. I am using MySQL 5.6 on Ubuntu and the server has no problem at all other than this issue. When I try to insert a simple "1" into a single column on a table (this is literally the only field), nothing happens. I have run into similar issues before, but using the same code on a different database, but with a much more complex structure. I have no idea if this is an issue with the server or an issue with the database itself. My server sits on the same network as my development machine, so I can't test on my local machine. I just get no errors and nothing is inserted. A: Are you sure there are not any table locks acquired, is there any logs indicating anything's going on, are there any entries in the output of show processlist that are waiting for something? Changing motifs of follicle-stimulating hormone receptor signaling during early testicular development. Mouse testes contain a highly abundant population of gonocytes, which proliferate at a high rate and differentiate into spermatogonia. Follicle-stimulating hormone (FSH) acts as the principal hormone in the control of male gamete production. Exposure to elevated doses of FSH causes gonocyte proliferation and spermatogenesis. In this study, we show that FSH signaling in gonocytes involves activation of proteins that have been previously associated with ovarian cells (FSH receptor, choriogonadotropin receptor, adenylyl cyclase and cAMP-dependent protein kinase). However, in the absence of cAMP,
