Introduction AutoCAD is the most widely used commercial CAD product. According to the latest official statistics, the release of AutoCAD is in the area of 40% of all CAD installations. AutoCAD became the first software application released in 1982 and has been developed since that time. It is available as desktop, mobile and web applications. With the development of computing technology, the need for professional AutoCAD users has increased, and the application is now being used in all industries. Although it is a very powerful tool, AutoCAD is not a computer with graphics or CAD capabilities, but a complete CAD product. AutoCAD is considered a complete package for mechanical and architectural design, drafting, 3D modeling and technical drawing, as well as for installation planning, documentation, and construction and maintenance work. It is also considered a powerful tool for engineering drawing and sheet metal designing. It can be used by itself or integrated with other Autodesk products. When integrated with other applications, the result is that data is shared between the programs. Designing and drafting can be performed with the same software. This is essential for modern product development. The current version of AutoCAD is released in April 2019 and it is available in four language versions: English, German, French, and Spanish. Layout View in AutoCAD AutoCAD has a Layout View, which is a special mode in which a 2D design, or CAD drawing, can be viewed in the shape of a 3D model. The model can be created using a 3D modeling tool or built directly in AutoCAD. The design must be planned to appear in the correct perspective before this function can be successfully used. The process can be made more efficient by constructing the drawing views in advance, with a viewfinder, and then adding them to the drawing. In the 3D model, objects are made as polylines and polyplanes, with the edges being part of a polyline or polyplane if they extend beyond the object's bounding box. Each edge can have three types of properties: A real edge with the value of its length or area, a mathematical edge as its edge length (usually measured in "points") or area, and a nominal edge with no actual or real value. Grids and constraints in AutoCAD In addition to geometric constraints, AutoCAD and other CAD software can have grids, which are guides that mark off predetermined distances in a drawing. The user can determine where these grids appear and how they can be positioned. If no position is specified, the grid will appear in the viewport. AutoCAD can display the grid line spacing and grid line option. As of Release 12, AutoCAD has a large number of predefined grids that can be imported from Autodesk 360 3D Warehouse (formerly Autodesk 3D Warehouse) and other sources. A user may draw custom grids for a particular sheet, project or drawing. Creating custom grids requires CAD skills. Reference Frames in AutoCAD AutoCAD uses reference frames as a means of providing a 2D coordinate system for positioning items in a drawing. A reference frame may have one, two or more axes of coordinates. The axes of a reference frame are fixed and reference all objects in the drawing. For example, the x-axis can be oriented parallel to the sheet plane of the drawing, the y-axis orthogonal to the sheet plane, the z-axis in the direction of the "opener" or the axis that intersects the last closed face or edge that the z-axis has a real or meaningful dimension with. The z-axis may not necessarily be orthogonal to the x-y-plane. The automatic detection of an orthogonal reference frame is a feature of ca3bfb1094

Generating a USB Key On Windows run the setup.exe, choose option "Copy to USB", and follow the instructions. On Mac OSX run the setup-mac.pkg, and follow the instructions. Generating a DVD Key On Windows use win.bat On Mac OSX use setup-mac.pkg Note: If you already have Autocad installed, you don't need to re-activate it. Important: After activating the license on your Autodesk account, you must re-activate on a new project. Also note that if you have Autocad 2008/2010 installed on your computer, then you are only able to use the key generated from the autocad-2010.exe Q: Return data based on criteria (read only) with excel vba I have a workbook which contains two sheets. The first sheet has six columns. My requirements are that I only want to see one of the first four columns based on criteria on the 2nd sheet. The 2nd sheet contains a list of events and their corresponding status, for example: Event 1 has a status of Open Event 2 has a status of closed The data in the 2nd sheet looks like this: | Event | Status | |-----|:-----|-----|-----| | Event 1 | Open | | Event 2 | Closed | | Event 3 | Closed | | Event 4 | Open
