We report a systematic study on the nucleation and growth of poly(styrene) (PS) on the Si(001) surface in the presence of various molecular solvent species on the Si(001) surface. Molecular dynamics simulations reveal that octamethylcyclotetrasiloxane (OMCTS) strongly prefers to adsorb on the Si(001) surface while tridecafluoro-1,1,2,2-tetrahydrooctyl trichlorosilane (FDTs) does not adsorb on the clean Si(001) surface. In contrast, the

growth and interaction of PS from the monomer with adsorbed OMCTS are similar to those with the vapor phase PS. Thus, we conclude that the vapor phase PS on the Si(001) surface is transported to the adsorbed OMCTS, which plays an important role in the nucleation and growth of PS on the Si(001) surface.
