We are now trying out enhancements to the Color panel's masking tools (including automatic re-sizing of masks to fit parts of artwork), as well as color management both for Smart Objects and color independent of that layer. Also, layers can now be renamed while they are open. An important if somewhat complex addition to this release is Fill Layers. These are like pattern layers, but they create and fill an area with your content (like a decorative pattern or an image such as a magazine) instead of referencing an image. For example, you can create a blue circle (like a star, using a gradient effect) that fills the entire canvas. A good idea is to use a Brush to paint this in. You can create a pattern fill layer, add a pattern to it, and another layer to create a blue star. An advantage of fill layers is the ability to convert a solid fill into background (like a white color). Fill layers also remember their settings (in terms of positioning and effect) and their history, enabling you to keep digesting your work without having to start from scratch. We've also added many tweaks to Paths, including a new feature for creating curves with pairs of anchor points and a new process for featuring a custom shape. When you select a triangle, for example, Photoshop Elements defaults to creating a parallelogram; you can change that or use the new "Draw Paths as Parallel" option to create a triangle. Paint Palettes have never been more powerful. Grayscale, Hue/Saturation, and Layers preserve your colors in private areas; you can duplicate these palettes at the same time and define groups of them. New Blue Kit palette has 96 colors and has one master color (used in the default color scheme) which makes it similar to the Pantone system (which is similar to the new Brighten & Contrast kit). In the new Radial Blur effect, foreshadowing layers are used for highlights and shadows. Plus, Refine Edge is timelier (without the need to manually move handles).

To start you off, it's important to realize that Photoshop has two sides—the mostly graphical program that let's you use all of its power, but also a scoring area (rendering area or canvas) where all of the creation happens. If you are a Photoshop user then you might want to take a look at the new Masking Theater. It allows you to easily mask layers on your photos. You can mask layers you don't want on your final image, as well as hide selected layers or all of the layers on your image. Once you mask a layer, you can paint on the layer to make your adjustments. The Lens Correction feature allows you improve the sharpness of an image. If you take a picture and it's really blurry, the new feature will automatically attempt to correct it. This new feature will create more noise than the previous version of Photoshop had, so be aware of that before making any adjustments. If you have Photoshop and more recently, have been working with the Edit > Fill command, then here is a quick update on how to correct that annoying fill window under the background layer. Fill is an option that replaces the original color with a color that looks like it came from a certain color swatch. The Fill command under the Background layer is only available on a layer that is not a group layer. You have to create a new layer that is a group before the Fill command works. If you're working with a camera that has a bracketing feature, then you're probably familiar with the viewfinder and shooting modes (more on viewfinder options below). Photoshop now allows you to copy your bracketed images directly to a continuous shoot. It's great if you're shooting a travel or event. You don't have to figure out how to shoot in a new mode, wait for each image, and combine the shots together. You can just shoot continuously with the settings you prefer, and Photoshop will build an HDR for you.
