Adobe CS5 introduced the idea of a Cloud Folder, which is what we've talked about all along. Instead of sticking it in your photo program's drives or saving files to your computer's hard drive, the folder can be pushed out to the cloud from where they can then be shared, or retrieved by the end user for use or editing. Given that the article you're reading on the cloud is sent out to an editorial board or publication through an online editor, you can see just how this removes a headache from either side. As long as you have a reliable Internet connection, the Cloud Folders can be pushed as often as you like, and even be kept synced over the Internet 24/7 where their content can be accessed by authorized end users as well as for testing. Sure, it might seem a tad presumptuous to count on the cloud's infrastructure. However, given that lightspeed Internet access is most certainly a thing, it's not that far of a reach to depend on. In a way, this is the true replacement for the days when photos were clipped to an envelope to mail to somebody as hard drive space was not in use. The days of lightening the bazillion-fold, posting photos yourself, and trusting that the mailman does the right thing are now a thing of the past. Adobe's Cloud Folders, therefore, are a true throwback to the age of the USPS mailbox and those pesky paper clips...and are actually a better and more effective way to store digital files, indirectly at least, than our paper mailboxes. Why bother having printed photographs (or scanned images, which are even less durable) around in a mailbox when you could have something online that's actually accessible every time you need it and you can access these files when you need them. Why use paper printouts when you can have well indexed, searchable, and viewable online files in the Cloud? It's simply a better way.

“Photoshop, like prior versions, will continue to be released for Mac, Windows and Linux. However, we have a smaller team and fewer resources to maintain that port, so we’re looking to consolidate all of our efforts into a single team and product. With the focus on macOS we’re not intending to support Windows for the foreseeable future.” - Author: Adobe forums

Non-destructive selections are another key new feature in the latest Photoshop release. In previous versions, this feature could only be used in Photoshop Elements, but Photoshop now also supports it. Selection tools can be used to check the selection as you work, making it easy to see which areas have already been selected. These selections can be deleted or modified at any time without affecting the original image. That means that you can redo, reject, or make changes to your selection without causing any undesired changes to the rest of the image. A new feature called "Snap to Pixel" is also included which will again allow you to select an area of your image that's either static or moving quickly and have it only highlight as a single pixel. This helps you to easily get around potential problems such as edges and other objects moving outside of the selected area. In addition, for scalable objects such as layers or paths, you can now easily scale them with no impact on the area around the selection. In addition to the non-destructive tools introduced with Photoshop CC (Creative Cloud), the new Luminance HDR feature offers photographers a new way to capture amazing photos via HDR photography. The latest version of Photoshop allows you to apply standard and custom luminance-based adjustments to reflect consistent settings, as well as take advantage of luminance-based adjustments already made in Photoshop.
